

## Modules whose maximal submodules have $\tau$ -supplements

Engin Büyükaşık

Communicated by R. Wisbauer

**ABSTRACT.** Let  $R$  be a ring and  $\tau$  be a preradical for the category of left  $R$ -modules. In this paper, we study on modules whose maximal submodules have  $\tau$ -supplements. We give some characterizations of these modules in terms their certain submodules, so called  $\tau$ -local submodules. For some certain preradicals  $\tau$ , i.e.  $\tau = \delta$  and idempotent  $\tau$ , we prove that every maximal submodule of  $M$  has a  $\tau$ -supplement if and only if every cofinite submodule of  $M$  has a  $\tau$ -supplement. For a radical  $\tau$  on  $R\text{-Mod}$ , we prove that, for every  $R$ -module every submodule is a  $\tau$ -supplement if and only if  $R/\tau(R)$  is semisimple and  $\tau$  is hereditary.

### 1. Introduction

Throughout this paper, we assume that all rings are associative with identity and all modules are unital left modules. For a module  $M$ , by  $N \subseteq M$  we shall mean that  $N$  is a submodule of  $M$ . A submodule  $N \subseteq M$  is called *small*, denoted by  $N \ll M$ , if  $N + L \neq M$  for all proper submodules  $L$  of  $M$ . A module  $M$  is called *supplemented* if for any submodule  $K$  of  $M$  there exists a submodule  $L$  of  $M$  such that  $M = K + L$  and  $K \cap L \ll L$ . In [2],  $\tau$ -supplemented modules are defined as a proper generalization of supplemented modules, for an arbitrary preradical  $\tau$ . Namely, a module  $M$  is called  $\tau$ -*supplemented* if for any submodule  $K$  of  $M$  there exists a submodule  $L$  of  $M$  such that  $M = K + L$  and  $K \cap L \subseteq \tau(L)$ . Another generalization of supplemented modules are the modules  $M$  whose cofinite submodules (i.e. submodules  $U$  of  $M$  such that  $M/U$  is finitely

**Key words and phrases:** preradical,  $\tau$ -supplement,  $\tau$ -local.

generated) have supplements (see, [1]). These modules are termed as *cofinitely supplemented* modules. A module  $M$  is cofinitely supplemented if and only if every maximal submodule of  $M$  has a supplement (see, [1, Theorem 2.8]). In [5], a module  $M$  is called *cofinitely Rad-supplemented* if every cofinite submodule  $U$  of  $M$  has a Rad-supplement in  $M$ . Cofinitely Rad-supplemented modules are characterized as those modules for which every maximal submodule has a Rad-supplement in  $M$  (see, [5, Theorem 3.7]). In light of these characterizations, we study the modules whose maximal submodules have  $\tau$ -supplements for a preradical  $\tau$ , and we call these modules *maximally  $\tau$ -supplemented*. A module  $M$  is said to be *cofinitely  $\tau$ -supplemented* if every cofinite submodule of  $M$  has a  $\tau$ -supplement. From the definitions, it is clear that an  $R$ -module  $M$  is maximally (Rad-)supplemented if and only if every cofinite submodule of  $M$  has a (Rad-)supplement in  $M$ .

For the definitions and terminology used in this paper we refer to [6] and [8].

A module  $N$  is said to be *hollow* if each proper submodule of  $N$  is small in  $N$ . A module that has a largest proper submodule is said to be *local*. Clearly each local module is hollow. Hollow modules play an important role in the study of supplemented modules and their generalizations. As a generalization of hollow modules we define  $\tau$ -local modules. Namely, we call a module  $N$   *$\tau$ -local* if either  $\tau(N) = N$  or  $\tau(N)$  is a maximal submodule of  $N$ .

The paper is organized as follows. In section 2, we characterize maximally  $\tau$ -supplemented modules for arbitrary preradicals. First we prove some closure properties of these modules. Namely, we prove that maximally  $\tau$ -supplemented modules are closed under homomorphic images and arbitrary sums. For any preradical  $\tau$ ,  $\tau$ -supplements of maximal submodules are  $\tau$ -local. This fact allows us to give some characterizations of maximally  $\tau$ -supplemented modules in terms of  $\tau$ -local submodules. For a module  $M$  if  $\tau$ -local submodules of  $M$  are maximally  $\tau$ -supplemented then,  $M$  is maximally  $\tau$ -supplemented if and only if  $M/Loc_\tau(M)$  has no maximal submodules, where  $Loc_\tau(M)$  is the sum of all  $\tau$ -local submodules of  $M$ .

In section 3 and section 4, we consider the cases when  $\tau$  is idempotent and  $\tau = \delta$ . In these cases, we prove that  $\tau$ -local modules are cofinitely  $\tau$ -supplemented. Using this fact, we obtain that  $M$  is maximally  $\tau$ -supplemented if and only if  $M$  is cofinitely  $\tau$ -supplemented. As a consequence we show that, a finitely generated module is  $\tau$ -supplemented if and only if it is a finite sum of  $\tau$ -local modules.

In the last section, we deal with the modules whose all submodules are  $\tau$ -supplements, for a radical  $\tau$ . We prove that if for every module  $M$  the

submodule  $\tau(M)$  is a supplement in  $M$  then  $\tau$  is an idempotent radical. For a ring  $R$  we prove that, for each module  $M \in \mathbf{R}\text{-Mod}$  every submodule of  $M$  is a  $\tau$ -supplement in  $M$  if and only if  $R/\tau(R)$  is semisimple and  $\tau$  is hereditary.

Let  $\mathbf{R}\text{-Mod}$  be the category of left  $R$ -modules. A functor  $\tau : \mathbf{R}\text{-Mod} \rightarrow \mathbf{R}\text{-Mod}$  is said to be a *preradical* if  $\tau(N) \subseteq N$  for each  $N \in \mathbf{R}\text{-Mod}$  and for each homomorphism  $f : M \rightarrow M'$  in  $\mathbf{R}\text{-Mod}$ , we have  $f(\tau(M)) \subseteq \tau(M')$ . A preradical  $\tau$  is said to be *radical* if  $\tau(N/\tau(N)) = 0$  for each  $N \in \mathbf{R}\text{-Mod}$ .

## 2. Maximally $\tau$ -supplemented modules

In this section, unless otherwise stated, we assume that  $\tau$  is a preradical on  $\mathbf{R}\text{-Mod}$ . In order to give some characterizations of maximally  $\tau$ -supplemented modules we begin with the following lemma.

**Lemma 2.1.** *Let  $M$  be an  $R$ -module and let  $N$  be a maximally  $\tau$ -supplemented submodule of  $M$ . If  $K$  is a maximal submodule of  $M$  such that  $K + N = M$  then  $K$  has a  $\tau$ -supplement in  $M$ .*

*Proof.* We have  $N/(N \cap K) \simeq (K + N)/K = M/K$  is simple. Then  $N \cap K$  is a maximal submodule of  $N$  and so  $N \cap K$  has a  $\tau$ -supplement, say  $L$ , in  $N$  by the hypothesis. That is,  $N \cap K + L = N$  and  $(N \cap K) \cap L = K \cap L \subseteq \tau(L)$ . Also,  $M = K + N = K + N \cap K + L = K + L$ . Therefore  $L$  is a  $\tau$ -supplement of  $K$  in  $M$ .  $\square$

**Lemma 2.2.** *Let  $N$  be a maximal submodule of a module  $M$  and  $L$  be a  $\tau$ -supplement of  $N$  in  $M$ . Then  $L$  is a  $\tau$ -local submodule of  $M$ .*

*Proof.* Suppose  $\tau(L) \neq L$ . Since  $L$  is a  $\tau$ -supplement of  $N$  in  $M$  we have  $M = N + L$  and  $L \cap N \subseteq \tau(L)$ . Now  $L/(L \cap N) \simeq M/N$  is simple, and so  $L \cap N$  is a maximal submodule of  $L$ . Therefore  $L \cap N = \tau(L)$  i.e.  $\tau(L)$  is a maximal submodule of  $L$ . Hence  $L$  is a  $\tau$ -local submodule of  $M$ .  $\square$

**Proposition 2.3.** *Let  $M$  be an  $R$ -module. Suppose  $M = \sum_{i \in I} N_i$ , where  $I$  is an arbitrary index set and  $N_i$  is a maximally  $\tau$ -supplemented submodule of  $M$  for each  $i \in I$ . Then  $M$  is a maximally  $\tau$ -supplemented module.*

*Proof.* Let  $K$  be a maximal submodule of  $M$ . Since  $K$  is a proper submodule of  $M$ , there exists  $j \in I$  such that  $N_j \not\subseteq K$ . Then  $K + N_j = M$ , and so  $K$  has a  $\tau$ -supplement in  $M$  by Lemma 2.1. Therefore  $M$  is a maximally  $\tau$ -supplemented module.  $\square$

**Lemma 2.4.** *Let  $M$  be a module and  $L$  be a maximally  $\tau$ -supplemented submodule of  $M$ . If  $M/L$  has no maximal submodules then  $M$  is maximally  $\tau$ -supplemented.*

*Proof.* Let  $K$  be a maximal submodule of  $M$ . Since  $M/L$  has no maximal submodules, we have  $K + L = M$ . Then  $L/(L \cap K) \simeq M/K$  is simple, and so  $L \cap K$  is a maximal submodule of  $L$ . Let  $L'$  be a  $\tau$ -supplement of  $L \cap K$  in  $L$ . Then  $(L \cap K) + L' = L$  and  $(L \cap K) \cap L' \subseteq \tau(L')$ . Since  $M = K + L = K + L'$  and  $K \cap L' \subseteq \tau(L')$ , the submodule  $L'$  is a  $\tau$ -supplement of  $K$  in  $M$ . Hence  $M$  is maximally  $\tau$ -supplemented.  $\square$

For a module  $M$  let  $Loc_\tau(M)$  be the sum of all  $\tau$ -local submodules of  $M$ .

**Theorem 2.5.** *For an  $R$ -module  $M$  suppose  $\tau$ -local submodules of  $M$  are maximally  $\tau$ -supplemented. Then the following are equivalent.*

- (1)  $M$  is maximally  $\tau$ -supplemented.
- (2)  $M/Loc_\tau(M)$  has no maximal submodules.
- (3)  $M/\Lambda(M)$  has no maximal submodules, where  $\Lambda(M)$  is the sum of maximally  $\tau$ -supplemented submodules of  $M$ .

*Proof.* (1)  $\Rightarrow$  (2) Let  $N$  be a maximal submodule of  $M$  such that  $Loc_\tau(M) \subseteq N$ . By the hypothesis,  $N$  has a  $\tau$ -supplement  $L$  in  $M$ . By Lemma 2.2,  $L$  is  $\tau$ -local, and so  $L \subseteq Loc_\tau(M) \subseteq N$ , a contradiction. This implies that  $Loc_\tau(M)$  is not contained in any maximal submodule of  $M$ . This proves (2).

(2)  $\Rightarrow$  (3) By hypothesis and by Proposition 2.3,  $Loc_\tau(M)$  is maximally  $\tau$ -supplemented, and so  $Loc_\tau(M) \subseteq \Lambda(M)$ . Now the proof is obvious.

(3)  $\Rightarrow$  (1) By Proposition 2.3,  $\Lambda(M)$  is maximally  $\tau$ -supplemented. Therefore  $M$  is maximally  $\tau$ -supplemented by Lemma 2.4.  $\square$

### 3. Idempotent preradicals

A preradical  $\tau$  is said to be idempotent if  $\tau(\tau(N)) = \tau(N)$  for each  $R$ -module  $N$  (see, [6, 6.4]). In this section, for an idempotent preradical  $\tau$ , we shall characterize the modules whose maximal submodules have  $\tau$ -supplements. We see that these modules coincide with the modules whose cofinite submodules have  $\tau$ -supplements.

The following lemma is trivial, we include it for completeness.

**Lemma 3.1.** *Let  $\tau$  be a preradical and  $M$  be an  $R$ -module such that  $\tau(M) = M$ . Then  $M$  is  $\tau$ -supplemented.*

*Proof.* Let  $K \subseteq M$ . Then  $K + M = M$  and  $K \cap M = K \subseteq \tau(M)$ . That is  $M$  is a  $\tau$ -supplement of  $K$  in  $M$ . Hence  $M$  is  $\tau$ -supplemented.  $\square$

**Proposition 3.2.** [2, 2.3(1)] Let  $L_1, U \subseteq L$  be submodules where  $L_1$  is  $\tau$ -supplemented. If  $L_1 + U$  has a  $\tau$ -supplement in  $L$ , then so does  $U$ .

**Lemma 3.3.** Arbitrary sum of cofinitely  $\tau$ -supplemented modules is cofinitely  $\tau$ -supplemented. That is, for an index set  $I$ , if  $M = \sum_{i \in I} M_i$ , where  $M_i$  is cofinitely  $\tau$ -supplemented for each  $i \in I$ , then  $M$  is cofinitely  $\tau$ -supplemented.

*Proof.* Similar to the proof of [1, Corollary 2.4].  $\square$

**Proposition 3.4.** Let  $\tau$  be an idempotent preradical and  $M$  be a  $\tau$ -local module. Then  $M$  is  $\tau$ -supplemented.

*Proof.* If  $\tau(M) = M$  then  $M$  is  $\tau$ -supplemented by Lemma 3.1. Suppose  $\tau(M)$  is a maximal submodule of  $M$  and let  $U$  be a submodule of  $M$ . Now, we have either  $U \subseteq \tau(M)$  or  $M = U + \tau(M)$ . If  $U \subseteq \tau(M)$ , then  $M$  is a  $\tau$ -supplement of  $U$  in  $M$ . Suppose  $U + \tau(M) = M$ . Since  $\tau$  is idempotent,  $\tau(\tau(M)) = \tau(M)$ , and hence  $\tau(M)$  is  $\tau$ -supplemented. So that  $U$  has a  $\tau$ -supplement in  $M$  by Proposition 3.2.  $\square$

**Theorem 3.5.** Let  $\tau$  be an idempotent preradical and  $M$  be an  $R$ -module. The following are equivalent.

- (1)  $M$  is cofinitely  $\tau$ -supplemented.
- (2)  $M$  is maximally  $\tau$ -supplemented.
- (3)  $M/Loc_\tau(M)$  has no maximal submodules.

*Proof.* (1)  $\Rightarrow$  (2) is clear. (2)  $\Rightarrow$  (3) By Proposition 3.4 and Theorem 2.5.

(3)  $\Rightarrow$  (1) Let  $U$  be a cofinite submodule of  $M$ . Then  $U + Loc_\tau(M)$  is also a cofinite submodule of  $M$ . If  $U + Loc_\tau(M)$  is a proper submodule of  $M$ , then we get a maximal submodule containing  $U + Loc_\tau(M)$  and hence containing  $Loc_\tau(M)$ . But this contradicts with the hypothesis. Hence we must have  $U + Loc_\tau(M) = M$ . Since  $U$  is a cofinite submodule of  $M$ , we have  $M = U + T_1 + T_2 + \cdots + T_n$ , where  $T_i$  is a  $\tau$ -local submodule of  $M$  for each  $i = 1, \dots, n$ . By Proposition 3.4,  $T_i$  is  $\tau$ -supplemented for each  $i = 1, \dots, n$  and hence  $T_1 + T_2 + \cdots + T_n$  is  $\tau$ -supplemented by [2, 2.3(2)]. Then  $U$  has a  $\tau$ -supplement in  $M$  by Proposition 3.2. Hence  $M$  is cofinitely  $\tau$ -supplemented.  $\square$

Since every submodule of a finitely generated module is cofinite, the notions of being  $\tau$ -supplemented and being cofinitely  $\tau$ -supplemented coincide for finitely generated modules. Hence we obtain the following by Theorem 3.5.

**Corollary 3.6.** *For a finitely generated module  $M$ , the following are equivalent.*

- (1)  $M$  is  $\tau$ -supplemented.
- (2) Every maximal submodule of  $M$  has a  $\tau$ -supplement.
- (3)  $M = T_1 + T_2 + \dots + T_n$  where  $T_i$  is  $\tau$ -local for each  $i = 1, \dots, n$ .

#### 4. Generalized cofinitely $\delta$ -supplemented modules

In this section we shall consider the case  $\tau = \delta$ . We call an  $R$ -module  $M$  *generalized (cofinitely)  $\delta$ -supplemented* if for every (cofinite) submodule  $U$  of  $M$ , there exists a submodule  $V$  of  $M$  such that  $U + V = M$  and  $U \cap V \subseteq \delta(V)$ . In this case, the submodule  $V$  is called a *generalized  $\delta$ -supplement* of  $U$  in  $M$ .

Recall that a module  $M$  is said to be *singular* if  $M \simeq L/K$  where  $L, K$  are  $R$ -modules and  $K \trianglelefteq L$ , that is,  $K \cap T \neq 0$  for each nonzero submodule  $T \subseteq L$ .

For a ring  $R$ , let  $\mathcal{P}$  be the class of all singular simple left  $R$ -modules. Then for an  $R$ -module  $M$ , as in [7],

$$\delta(M) = \bigcap \{ \text{Ker } f \mid f \in \text{Hom}(M, S), S \in \mathcal{P} \}.$$

A submodule  $N$  of a module  $M$  is said to be  *$\delta$ -small* in  $M$ , denoted as  $N \ll_{\delta} M$ , if  $N + L \neq M$  for any proper submodule  $L$  of  $M$  with  $M/L$  singular.

**Lemma 4.1.** [7, Lemma 1.2, Lemma 1.3] *Let  $M$  be an  $R$ -module and  $N, L \subseteq M$  then,*

- (1) *A submodule  $N \subseteq M$  is  $\delta$ -small if and only if for all submodules  $X \subseteq M$ :*

$$\text{if } X + N = M, \text{ then } M = X \oplus Y$$

*for a projective semisimple submodule  $Y$  with  $Y \subseteq N$ .*

- (2)  *$N + L \ll_{\delta} M$  if and only if  $N \ll_{\delta} M$  and  $L \ll_{\delta} M$ .*

**Lemma 4.2.** *Let  $M$  be a  $\delta$ -local module. Then  $M$  is cofinitely  $\delta$ -supplemented.*

*Proof.* If  $\delta(M) = M$  then  $M$  is cofinitely  $\delta$ -supplemented by Lemma 3.1. Suppose  $\delta(M)$  is a maximal submodule of  $M$ . Let  $U$  be a cofinite submodule of  $M$ . Since  $\delta(M)$  is a maximal submodule of  $M$ , we have

either  $U \subseteq \delta(M)$  or  $U + \delta(M) = M$ . First suppose  $U \subseteq \delta(M)$ . In this case, clearly  $M$  is a  $\delta$ -supplement of  $U$  in  $M$ . Now, suppose  $U + \delta(M) = M$ . Then there exist  $\delta$ -small submodules  $L_1, L_2, \dots, L_n$  of  $M$  such that  $U + L_1 + \dots + L_n = M$ . By Lemma 4.1(2), the submodule  $N = L_1 + \dots + L_n$  is  $\delta$ -small in  $M$ . So that by Lemma 4.1(1) there exists a submodule  $Y$  of  $N$  such that  $M = U \oplus Y$ . That is,  $Y$  is a  $\delta$ -supplement of  $U$  in  $M$ .  $\square$

From the proof of Lemma 4.2 we have the following.

**Corollary 4.3.** *Let  $M$  be a  $\delta$ -local module. Then every cofinite submodule of  $M$  has a generalized  $\delta$ -supplement that is a direct summand.*

In [5], for the case  $\tau = \text{Rad}$  it is proved that a module  $M$  is maximally  $\tau$ -supplemented if and only if every cofinite submodule of  $M$  has a  $\tau$ -supplement. We have a similar characterization when  $\tau = \delta$ , as follows.

For a module  $M$  let  $\text{Loc}_\delta(M)$  be the sum of all  $\delta$ -local submodules of  $M$ .

**Theorem 4.4.** *For an  $R$ -module  $M$ , the following are equivalent.*

- (1)  $M$  is generalized cofinitely  $\delta$ -supplemented.
- (2)  $M$  is maximally  $\delta$ -supplemented.
- (3)  $M/\text{Loc}_\delta(M)$  has no maximal submodules.
- (4)  $M/\Lambda(M)$  has no maximal submodules, where  $\Lambda(M)$  is the sum of maximally  $\delta$ -supplemented submodules of  $M$ .

*Proof.* (1)  $\Rightarrow$  (2) is clear. (2)  $\Leftrightarrow$  (3)  $\Leftrightarrow$  (4) By Theorem 2.5. (3)  $\Rightarrow$  (1) Similar to the proof of Theorem 3.5.  $\square$

**Corollary 4.5.** *For a finitely generated module  $M$ , the following are equivalent.*

- (1)  $M$  is generalized  $\delta$ -supplemented.
- (2) Every maximal submodule of  $M$  has a generalized  $\delta$ -supplement.
- (3)  $M = D_1 + D_2 + \dots + D_n$ , where  $D_i$  is  $\delta$ -local for each  $i = 1, \dots, n$ .

## 5. When all submodules of a module are $\tau$ -supplements

Let  $\tau$  be a radical on  $R\text{-Mod}$  and  $M$  be an  $R$ -module. Recall that a preradical  $\tau$  is said to be *hereditary* (or *left exact*) if for any module  $N$  and  $K \subseteq N$  we have  $\tau(K) = K \cap \tau(N)$ . Hereditary preradicals are idempotent (see, [6, 6.9 (1)]).

**Proposition 5.1.** [3, proposition 4.1] *Let  $\tau$  be radical and  $V$  be a  $\tau$ -supplement submodule of  $M$ . Then  $\tau(V) = V \cap \tau(M)$ .*

**Theorem 5.2.** *Let  $\tau$  be a radical on  $R\text{-Mod}$ . If  $\tau(M)$  is a  $\tau$ -supplement in  $M$  for every left  $R$ -module  $M$ , then  $\tau$  is an idempotent radical.*

*Proof.* Let  $N$  be an  $R$ -module. By hypothesis  $\tau(N)$  is a  $\tau$ -supplement in  $N$ . So that  $\tau(\tau(N)) = N \cap \tau(N) = \tau(N)$  by Proposition 5.1. This implies that  $\tau$  is idempotent.  $\square$

**Lemma 5.3.** *Let  $M$  be a module such that each submodule of  $M$  is a  $\tau$ -supplement in  $M$ . Then  $M/\tau(M)$  is semisimple.*

*Proof.* Let  $K/\tau(M)$  be a submodule of  $M/\tau(M)$ . By hypothesis  $K$  is a  $\tau$ -supplement in  $M$ , that is,  $K + L = M$  and  $K \cap L \subseteq \tau(K)$  for some submodule  $L$  of  $M$ . Then we have

$$M/\tau(M) = K/\tau(M) + (L + \tau(M))/\tau(M)$$

and

$$K/\tau(M) \cap (L + \tau(M))/\tau(M) = (K \cap L + \tau(M))/\tau(M) = 0.$$

That is,  $K/\tau(M)$  is a direct summand of  $M/\tau(M)$ . Hence  $M/\tau(M)$  is semisimple.  $\square$

**Theorem 5.4.** *For a ring  $R$  and a radical  $\tau$  on  $R\text{-Mod}$ , the following are equivalent.*

- (1) *For each  $M \in R\text{-Mod}$ , every submodule of  $M$  is a  $\tau$ -supplement in  $M$ .*
- (2)  *$R/\tau(R)$  is semisimple and  $\tau$  is hereditary.*

*Proof.* (1)  $\Rightarrow$  (2) By hypothesis every submodule of  ${}_R R$  is a  $\tau$ -supplement, so  $R/\tau(R)$  is semisimple by Lemma 5.3. Let  $N$  be an  $R$ -module and  $K \subseteq N$ . Since  $K$  is a  $\tau$ -supplement in  $N$ , we have  $\tau(K) = K \cap \tau(N)$  by Proposition 5.1. Hence  $\tau$  is hereditary by [6, 6.9.(1)].

(2)  $\Rightarrow$  (1) Since  $\tau(R)M \subseteq \tau(M)$ , the module  $M/\tau(M)$  is an  $R/\tau(R)$ -module. So that  $M/\tau(M)$  is a semisimple  $R/\tau(R)$ -module. Hence  $M/\tau(M)$  is a semisimple  $R$ -module. Let  $K$  be a submodule of  $M$ . Since  $M/\tau(M)$  is semisimple,

$$M/\tau(M) = [(K + \tau(M))/\tau(M)] \oplus L/\tau(M)$$

for some submodule  $L \subseteq M$ . That is,  $K + L = M$  and  $K \cap L \subseteq \tau(M)$ . Then  $K \cap L \subseteq K \cap \tau(M) = \tau(K)$ , by [6, 6.9.(1)(b)]. So that  $K$  is a  $\tau$ -supplement of  $L$  in  $M$ . Hence every submodule of  $M$  is a  $\tau$ -supplement in  $M$ .  $\square$
