

## Combinatorics of partial wreath power of finite inverse symmetric semigroup $\mathcal{IS}_d$

Yevgeniya Kochubinska

Communicated by A. P. Petravchuk

**ABSTRACT.** We study some combinatorial properties of  ${}^k_p\mathcal{IS}_d$ . In particular, we calculate its order, the number of idempotents and the number of  $\mathcal{D}$ -classes. For a given based graph  $\Gamma \subset T$  we compute the number of elements in its  $\mathcal{D}$ -class  $D_\Gamma$  and the number of  $\mathcal{R}$ - and  $\mathcal{L}$ -classes in  $D_\Gamma$ .

### Introduction

The wreath product of semigroups has appeared as a generalization to semigroups of the corresponding construction for groups. Firstly transformation wreath product of transformation semigroups has appeared as a natural generalization of the wreath product of permutation groups [1]. Later different modifications have been introduced, for instance, partial wreath product of arbitrary semigroup and semigroup of partial transformation was defined in [2] and construction related to this one, namely inverse wreath product of inverse semigroups, was proposed in [3]. Wreath products provide means to construct a semigroup with certain properties. They also appear in certain natural settings, that allows to lighten the study of known semigroups presenting them if possible as a wreath product of appropriate semigroups

The article discusses the partial wreath product of two finite symmetric semigroup  $\mathcal{IS}_d$  and a generalization of this construction to the case of more then two factors. It is proved that the partial wreath  $k$ -th power

**Key words and phrases:** *Wreath product, finite inverse symmetric semigroup, rooted tree, partial automorphism.*

of the semigroup  $\mathcal{IS}_d$  is isomorphic to the appropriate subsemigroup of semigroup of partial automorphisms of the rooted  $k$ -level  $d$ -regular tree. We study some combinatorial properties of  $\wr_p^k \mathcal{IS}_d$ , in particular, we calculate its order and the number of idempotents and the number of  $\mathcal{D}$ -classes. Also, we describe Green's relations of the partial wreath power of  $\mathcal{IS}_d$  and calculate the number of  $\mathcal{D}$ -classes, the number of elements in a given  $\mathcal{D}$ -class and the number of  $\mathcal{R}$ - and  $\mathcal{L}$ -classes in this  $\mathcal{D}$ -class.

## 1. The partial wreath power of semigroup $\mathcal{IS}_d$

Let  $\mathcal{N}_d = \{1, \dots, d\}$ . Define  $S^{P\mathcal{N}_d}$  by

$$S^{P\mathcal{N}_d} = \{f : \mathcal{N}_d \rightarrow \mathcal{IS}_d \mid \text{dom}(f) \subseteq \mathcal{N}_d\}.$$

as the set of functions from subsets of  $\mathcal{N}_d$  to  $\mathcal{IS}_d$ . If  $f, g \in S^{P\mathcal{N}_d}$ , we define the product  $fg$  by:

$$\text{dom}(fg) = \text{dom}(f) \cap \text{dom}(g), (fg)(x) = f(x)g(x) \text{ for all } x \in \text{dom}(fg).$$

If  $a \in \mathcal{IS}_d, f \in S^{P\mathcal{N}_d}$ , we define  $f^a$  by:

$$\begin{aligned} \text{dom}(f^a) &= \{x \in \text{dom}(a); xa \in \text{dom}(f)\} = (\text{ran}(a) \cap \text{dom}(f))a^{-1} \\ (f^a)(x) &= f(xa). \end{aligned}$$

**Definition.** The partial wreath square of semigroup  $\mathcal{IS}_d$  is defined as the set  $\{(f, a) \in S^{P\mathcal{N}_d} \times \mathcal{IS}_d \mid \text{dom}(f) = \text{dom}(a)\}$  with composition defined by

$$(f, a) \cdot (g, b) = (fg^a, ab)$$

Denote it by  $\mathcal{IS}_d \wr_p \mathcal{IS}_d$ .

The partial wreath square of  $\mathcal{IS}_d$  is a semigroup, moreover, it is an inverse semigroup [1, Lemmas 2.22 and 4.6]. We may recursively define any partial wreath power of the finite inverse symmetric semigroup.

**Definition.** The partial wreath  $k$ -th power of semigroup  $\mathcal{IS}_d$  is defined as semigroup  $\wr_p^k \mathcal{IS}_d = (\wr_p^{k-1} \mathcal{IS}_d) \wr_p \mathcal{IS}_d = \{(f, a) \in S_{k-1}^{P\mathcal{N}_d} \times \mathcal{IS}_d \mid \text{dom}(f) = \text{dom}(a)\}$  with composition defined by

$$(f, a) \cdot (g, b) = (fg^a, ab),$$

where  $S_{k-1}^{P\mathcal{N}_d} = \{f : \mathcal{N}_d \rightarrow \wr_p^{k-1} \mathcal{IS}_d, \text{dom}(f) \subseteq \mathcal{N}_d\}$ ,  $\wr_p^{k-1} \mathcal{IS}_d$  is the partial wreath  $(k-1)$ -th power of semigroup  $\mathcal{IS}_d$

For an arbitrary function  $F$  we denote  $F^k(x) = \underbrace{F(F \dots (F(x)) \dots)}_k$ .

**Proposition 1.**  $|\wr_p^k \mathcal{IS}_d| = S^k(1)$ , where  $S(x) = \sum_{i=1}^d \binom{d}{i}^2 i! x^i$

*Proof.* We provide the proof by induction on  $k$ .

Let  $k = 1$ , then  $|\mathcal{IS}_d| = \sum_{i=1}^d \binom{d}{i}^2 i! = S(1)$  (cf. [4]).

Assume that we know the order of the partial wreath  $(k-1)$ -th power of semigroup  $\mathcal{IS}_d$ :  $|\wr_p^{k-1} \mathcal{IS}_d| = S^{k-1}(1)$ . Prove that  $|\wr_p^k \mathcal{IS}_d| = S^k(1)$ . The elements of semigroup  $\wr_p^{k-1} \mathcal{IS}_d$  are pairs  $(f, a) \in S_{k-1}^{P\mathcal{N}_d} \times \mathcal{IS}_d$  with  $\text{dom}(f) = \text{dom}(a)$ . Let  $P_A = \{a \in \mathcal{IS}_d \mid \text{dom}(a) = A\}$ . Then the number of all such pairs  $(f, a)$  is equal to

$$\begin{aligned} \sum_{A \subset \mathcal{N}_d} \left| \wr_p^{k-1} \mathcal{IS}_d \right|^{|A|} \cdot |P_A| &= \sum_{i=1}^d \left| \wr_p^{k-1} \mathcal{IS}_d \right|^i \binom{d}{i}^2 i! \\ &= S\left(\left| \wr_p^{k-1} \mathcal{IS}_d \right|\right) = S(S^{k-1}(1)) = S^k(1). \quad (1) \end{aligned}$$

□

Let  $E(\mathcal{IS}_d)$  be the set of idempotents of semigroup  $\mathcal{IS}_d$ .

**Proposition 2.** *An element  $(f, a) \in \mathcal{IS}_d \wr_p \mathcal{IS}_d$  is an idempotent if and only if  $a \in E(\mathcal{IS}_d)$  and  $f(\text{dom}(a)) \subseteq E(\mathcal{IS}_d)$ .*

*Proof.* Let  $(f, a)$  be idempotent, then  $(f, a)(f, a) = (ff^a, a^2) = (f, a)$ . Hence,  $ff^a = f$ ,  $a^2 = a$ , i.e.,  $a \in \mathcal{IS}_d$  is an idempotent. It follows from the equality  $ff^a = f$  that for any  $c \in \text{dom}(a)$   $ff^a(ca) = f(ca)f^a(ca) = f(ca)f(ca^2) = f(ca)f(ca)$ .

Conversely, let  $(f, a) \in \wr_p^k \mathcal{IS}_d$  be such an element that  $a \in E(\mathcal{IS}_d)$  and  $f(\text{dom}(a)) \subseteq E(\mathcal{IS}_d)$ . Then for any  $c \in \text{dom}(a)$   $f(ca) = f(ca)f(ca)$ . So  $f(ca) = f(ca)f(ca) = f(ca)f(ca^2) = ff^a(ca)$ . Since it holds for all  $c \in \text{dom}(a)$ , we have  $(f, a)(f, a) = (f, a)$ . □

Let  $T_k^{(d)}$  be a rooted  $k$ -level  $d$ -regular tree. The partial automorphism of the tree  $T_k^{(d)}$  is such partial (i.e. not necessarily completely defined) injective map  $\varphi : VT_k^{(d)} \rightarrow VT_k^{(d)}$  that subgraphs generated by domain of  $\varphi$  and range of  $\varphi$  are isomorphic (i.e.  $\varphi$  maps isomorphically certain subgraph of the tree  $T_k^{(d)}$  on another subgraph of the same tree). Partial automorphisms form a semigroup under composition  $ab(x) = b(a(x))$ , we will denote it by  $\text{PAut } T_k^{(d)}$ . Evidently, this semigroup is an inverse semigroup. Let  $\text{ConPAut } T$  be the semigroup of partial automorphisms of the tree  $T$ , defined on a connected graph containing root and preserving the level of vertices. Further we will consider only partial automorphisms of this type.

**Theorem 1.** *Let  $T_k^{(d)}$  be a rooted  $k$ -level  $d$ -regular tree. Then*

$$\text{ConPAut } T_k^{(d)} \cong \underset{p}{\wr}^k \mathcal{IS}_d.$$

*Proof.* We provide the proof by induction on  $k$ .

Let  $T_1^{(d)}$  be one-level tree,  $\text{ConPAut } T_1^{(d)}$  be the semigroup of partial automorphisms of this tree defined as above. By definition,  $\text{ConPAut } T_1^{(d)}$  contains partial automorphisms defined on a connected subgraph and that fix the root vertex and preserve the level of vertices, then every partial automorphism  $\varphi \in \text{ConPAut } T_1^{(d)}$  is determined only by the vertices permutation satisfying condition

$$\varphi(i) = \begin{cases} a_i, & \text{if } i \in \text{dom}(\varphi); \\ \emptyset, & \text{otherwise.} \end{cases}$$

In other words,  $\varphi$  is the partial permutation from  $\mathcal{IS}_d$ . So, every partial automorphism  $\varphi \in \text{ConPAut } T_1^{(d)}$  is uniquely defined by partial permutation  $\sigma \in \mathcal{IS}_d$ . Thus, we have one-to-one correspondence between  $\text{ConPAut } T_1^{(d)}$  and  $\mathcal{IS}_d$ . Hence  $\text{ConPAut } T_1^{(d)} \cong \mathcal{IS}_d$ .

Assume that  $\wr_p^{k-1} \mathcal{IS}_d \cong \text{ConPAut}_{k-1}$ .

Prove that  $\wr_p^k \mathcal{IS}_d \cong \text{ConPAut}_k$ . Let  $\varphi \in \text{ConPAut}_k$  and  $V_i$  be the  $i$ -th level of the tree  $T_k^{(d)}$ . Define a map  $\psi : \text{ConPAut}_k \rightarrow \wr_p^k \mathcal{IS}_d$  by:  $\varphi \mapsto (\varphi|_{T_{k-1}}, \varphi|_{V_1})$ , where  $\varphi|_{T_{k-1}}$  is a partial automorphism that acts on the rooted subtrees, which root vertices lie on the first level of the tree  $T_k^{(d)}$  and belong to  $\text{dom}(\varphi|_{V_1})$ . Hence  $\varphi|_{V_1} \in \mathcal{IS}_d$  and  $\varphi|_{T_{k-1}} : \text{dom}(\varphi|_{V_1}) \rightarrow \wr_p^{k-1} \mathcal{IS}_d$ . Thus we may establish correspondence between given partial automorphism  $\varphi \in \text{ConPAut}_k$  and a unique pair  $(\sigma, f)$ , where  $\sigma \in \mathcal{IS}_d$ ,  $f : \mathcal{N}_d \rightarrow \wr_p^{k-1} \mathcal{IS}_d$ ,  $\text{dom}(f) = \text{dom}(\sigma)$ . And we have  $\text{ConPAut } T_k^{(d)} \cong \wr_p^k \mathcal{IS}_d$ . □

**Proposition 3.** *Let  $E(\wr_p^k \mathcal{IS}_d)$  be the set of idempotents of semigroup  $\wr_p^k \mathcal{IS}_d$ . Then  $|E(\wr_p^k \mathcal{IS}_d)| = F^k(1) = \underbrace{(((1+1)^d + 1)^d \dots + 1)^d}_k$ , where*

$$F(x) = (x+1)^d.$$

*Proof.* It follows from the Theorem 1 that there exists bijection between set of idempotents of semigroup  $\wr_p^k \mathcal{IS}_d$  and set of connected subgraphs of the tree  $T_k^{(d)}$  with different domains. We calculate number of idempotents as a number of such subgraphs of the tree  $T_k^{(d)}$ , because idempotents of  $\text{ConPAut } T_k^{(d)}$  are identity maps:  $id_\Gamma : \Gamma \rightarrow \Gamma$ ,  $\Gamma \subset T_k^{(d)}$ .

We compute their number by induction on  $k$ . Let  $k = 1$ , then  $\mathcal{I}\mathcal{S}_d = \mathcal{I}\mathcal{S}_d$ , consequently  $|E(\mathcal{I}_p^1 \mathcal{I}\mathcal{S}_d)| = |E(\mathcal{I}\mathcal{S}_d)| = 2^d = F(1)$ .

Assume that  $|E(\mathcal{I}_p^{k-1} \mathcal{I}\mathcal{S}_d)| = F^{k-1}(1) = |E(\text{ConPAut}T_k^{(d)})|$ .

Find now the number of idempotents of semigroup  $\text{ConPAut}T_k^{(d)}$ . For all  $i = 1, \dots, d$  we can choose  $i$ -element subset among the first level vertices in  $\binom{d}{i}$  ways. Denote these subsets  $A_i^j$ ,  $i = 1, \dots, d$ ,  $j = 1, \dots, \binom{d}{i}$ . Each vertex from  $A_i^j$  is the root vertex of  $(k-1)$ -level tree. We know the number of idempotents of the semigroup  $\text{ConPAut}T_k^{(d)}$ , then

$$\begin{aligned} |E(\mathcal{I}_p^k \mathcal{I}\mathcal{S}_d)| &= |E(\text{ConPAut}T_k^{(d)})| = \sum_{i=1}^d \binom{d}{i} (F^{k-1}(1))^i \\ &= (F^{k-1}(1) + 1)^d = F(F^{k-1}) = F^k(1). \end{aligned}$$

□

## 2. Combinatorics of Green's relations

**Theorem 2.** *Let  $(f, a), (g, b) \in \mathcal{I}_p^k \mathcal{I}\mathcal{S}_d$ . Then*

1.  $(f, a) \mathcal{L} (g, b)$  if and only if  $\text{ran}(a) = \text{ran}(b)$  and  $g^{b^{-1}}(z) \mathcal{L} f^{a^{-1}}(z)$  for all  $z \in \text{ran}(a)$ , where  $a^{-1}$  is the inverse element for  $a$ ;
2.  $(f, a) \mathcal{R} (g, b)$  if and only if  $\text{dom}(a) = \text{dom}(b)$  and  $f(z) \mathcal{R} g(z)$  for all  $z \in \text{dom}(a)$ ;
3.  $(f, a) \mathcal{H} (g, b)$  if and only if  $\text{ran}(a) = \text{ran}(b)$  and  $\text{dom}(a) = \text{dom}(b)$ ,  $g^{b^{-1}}(z) \mathcal{L} f^{a^{-1}}(z)$  and  $f(z) \mathcal{R} g(z)$  for  $z \in \text{dom}(a) \cap \text{ran}(a)$ ;
4.  $(f, a) \mathcal{D} (g, b)$  if and only if there exists a bijection map  $x : \text{dom}(b) \rightarrow \text{dom}(a)$  such that  $f(zx) \mathcal{D} g(z)$ .
5.  $\mathcal{D} = \mathcal{J}$ .

*Proof.* Green's relations on semigroup  $\mathcal{I}\mathcal{S}_d$  are described in [4].

1. Let  $(f, a) \mathcal{L} (g, b)$ , then there exist  $(u, x), (v, y) \in \mathcal{I}_p^k \mathcal{I}\mathcal{S}_d$  such that  $(u, x)(f, a) = (g, b)$  and  $(v, y)(g, b) = (f, a)$ , i.e.

$$\begin{aligned} (u, x)(f, a) &= (uf^x, xa) = (g, b), \\ (v, y)(g, b) &= (vg^y, yb) = (f, a). \end{aligned}$$

We get from these equalities that  $xa = b, yb = a$ , and therefore  $a \mathcal{L} b$  and then  $\text{ran}(a) = \text{ran}(b)$ , and also we get  $uf^x = g, vg^y = f$ .

Multiplying the both sides of the equality  $xa = b$  by  $a^{-1}$  from the left and by  $b^{-1}$  from the right we obtain  $b^{-1}x = a^{-1}$ . Analogously we obtain  $a^{-1}y = b$ . Put  $t = zb^{-1}$  for any  $z \in \text{dom}(b^{-1}) = \text{ran}(b)$ , then

$$\begin{aligned} uf^x(t) &= g(t), \\ u(t)f(tx) &= g(t), \\ u(zb^{-1})f(zb^{-1}x) &= u(zb^{-1})f(za^{-1}) = g(zb^{-1}), \\ u(zb^{-1})f^{a^{-1}}(z) &= g^{b^{-1}}(z). \end{aligned}$$

Putting  $t = za^{-1}$  for any  $z \in \text{ran}(a) = \text{ran}(b)$ , we analogously get  $v(za^{-1})g^{b^{-1}}(z) = f^{a^{-1}}(z)$ . We have  $u(zb^{-1})f^{a^{-1}}(z) = g^{b^{-1}}(z)$  and  $v(za^{-1})g^{b^{-1}}(z) = f^{a^{-1}}(z)$ . This implies  $f^{a^{-1}}(z) \mathcal{L} g^{b^{-1}}(z)$ ,  $z \in \text{ran}(a) = \text{ran}(b)$ .

Conversely, let  $\text{ran}(a) = \text{ran}(b)$  and  $f^{a^{-1}}(z) \mathcal{L} g^{b^{-1}}(z) \forall z \in \text{ran}(a) = \text{ran}(b)$ . From the first condition we get  $a \mathcal{L} b$ , and hence there exist  $x, y \in \mathcal{IS}_d$  such that  $xa = b, yb = a$ . From the second condition it follows that there exist functions  $u, v \in S_k^{PN_d}$  such that  $u(z)f^{a^{-1}}(z) = g^{b^{-1}}(z)$  and  $v(z)g^{b^{-1}}(z) = f^{a^{-1}}(z)$ ,  $z \in \text{ran}(a) = \text{ran}(b)$ . Consider  $(u, x), (v, y) \in \mathcal{I}_p^k \mathcal{IS}_d$ , where  $x, y, u, v$  are defined as above. Then

$$(u, x)(f, a) = (uf^x, xa) = (uf^{ba^{-1}}, b) = (g^{bb^{-1}}, b) = (g, b)$$

and in the same way we get  $(v, y)(g, b) = (f, a)$ . Therefore  $(f, a) \mathcal{L} (g, b)$ .

2. Let  $(f, a) \mathcal{R} (g, b)$ , then there exist  $(u, x), (v, y) \in \mathcal{I}_p^k \mathcal{IS}_d$  such that  $(f, a)(u, x) = (g, b)$ ,  $(g, b)(v, y) = (f, a)$ . This is equivalent to  $ax = b, by = a, fu^a = g, gv^b = f$ . This gives us the conditions  $a \mathcal{R} b$ , and hence  $\text{dom}(a) = \text{dom}(b)$ , and  $fu^a = g, gv^b = f$ . Consequently,  $f(z) \mathcal{R} g(z) \forall z \in \text{dom}(a)$ .

Conversely, let  $(f, a), (g, b) \in \mathcal{I}_p^k \mathcal{IS}_d$  and  $\text{dom}(a) = \text{dom}(b)$ ,  $f(z) \mathcal{R} g(z) \forall z \in \text{dom}(a)$ . From  $\text{dom}(a) = \text{dom}(b)$  it follows  $a \mathcal{R} b$ , then there exists  $x, y \in \mathcal{IS}_d$  such that  $ax = b, by = a$ , and from  $f(z) \mathcal{R} g(z) \forall z \in \text{dom}(a)$  it follows that there exist  $u', v' \in S_{k-1}^{PN_d}$  such that for any  $z \in \text{dom}(a)$   $fu'(z) = g(z), gv'(z) = f(z)$ . Define  $u, v \in S_{k-1}^{PN_d}$  by  $u(za) = u'(z), v(zb) = v'(z)$ . Then for  $t \in \text{dom}(a)$  it holds  $fu^a(t) = f(t)u(ta) = f(t)u'(t) = g(t)$  and  $gv^b(t) = f(t)$ , then

$$\begin{aligned} (f, a)(u, x) &= (fu^a, ax) = (g, b), \\ (g, b)(v, y) &= (f, a). \end{aligned}$$

Therefore,  $(f, a) \mathcal{R} (g, b)$ .

3. As  $\mathcal{H} = \mathcal{L} \wedge \mathcal{R}$ , this statement follows from the first and second ones.
4. Let  $(f, a) \mathcal{D} (g, b)$ . Then there exist  $(h, c) \in \mathcal{I}\mathcal{S}_d$  such that  $(f, a) \mathcal{L} (h, c)$  and  $(h, c) \mathcal{R} (g, b)$ . From  $(f, a) \mathcal{L} (h, c)$  we get that  $\text{ran}(a) = \text{ran}(c)$  and for  $z \in \text{ran}(a)$   $f^{a^{-1}}(z) \mathcal{L} h^{c^{-1}}(z)$ . Then there exist functions  $u$  and  $v$  such that  $u(z)f^{a^{-1}}(z) = h^{c^{-1}}(z)$  and  $v(z)h^{c^{-1}}(z) = f^{a^{-1}}(z)$ . Put  $x = a^{-1}c$ . By definition of  $\mathcal{I}\mathcal{S}_d$   $x$  is a partial bijection map. We now obtain  $f(zx) \mathcal{L} h(z)$ , and  $x : \text{dom}(c) \rightarrow \text{dom}(a)$ . From  $(h, c) \mathcal{R} (g, b)$  we have that for  $z \in \text{dom}(b)$ :  $h(z) \mathcal{R} g(z)$  and  $\text{dom}(b) = \text{dom}(c)$ . From  $\text{ran}(a) = \text{ran}(c)$  and  $\text{dom}(b) = \text{dom}(c)$  we get  $|\text{dom}(a)| = |\text{dom}(b)|$ . Thus there exists bijection  $x : \text{dom}(b) \rightarrow \text{dom}(a)$  such that  $f(zx) \mathcal{D} h(z)$ ,  $z \in \text{dom}(b) \cap \text{ran}(a)$ .

Conversely, assume that there exists a bijection map  $x : \text{dom}(b) \rightarrow \text{dom}(a)$  such that  $f(zx) \mathcal{D} g(z)$ , i.e. there exists a function  $h(z)$  such that  $f(zx) \mathcal{L} h(z)$  and  $h(z) \mathcal{R} g(z)$ . Let  $u'(z), v'(z) \in S^{P\mathcal{N}_d}$  satisfy conditions  $u'(z)f(zx) = u'f^x(z) = h(z)$  and  $v'(z)h(z) = f(zx)$ . Put  $c = xa$ , then  $c$  is partial bijection  $c : \text{dom}(b) \rightarrow \text{ran}(a)$  exists. Define  $u(z)$  by  $u(z) = u'(z)$  and  $v(z)$  by  $v(z) = v'(zx^{-1})$ . Then

$$\begin{aligned} (u, x)(f, a) &= (uf^x, xa) = (h, c), \\ (v, x^{-1})(h, c) &= (f, a). \end{aligned}$$

Hence  $(f, a) \mathcal{L} (h, c)$ . As  $h(z) \mathcal{R} g(z)$  and  $\text{dom}(c) = \text{dom}(b)$ , then  $(h, c) \mathcal{R} (g, b)$ . It implies  $(f, a) \mathcal{D} (g, b)$ .

5. As  $\mathcal{I}\mathcal{S}_d$  is finite then  $\mathcal{D} = \mathcal{J}$ .

□

**Corollary.** If  $(f, a), (g, b) \in \mathcal{I}\mathcal{S}_d$ , then

1.  $(f, a) \mathcal{L} (g, b)$  if and only if  $\text{ran}(a) = \text{ran}(b)$  and  $\text{ran}(g^{a^{-1}}(z)) = \text{ran}(f^{b^{-1}}(z))$  for all  $z \in \text{ran}(a)$ ;
2.  $(f, a) \mathcal{R} (g, b)$  if and only if  $\text{dom}(a) = \text{dom}(b)$  and  $\text{dom}(f(z)) = \text{dom}(g(z))$  for all  $z \in \text{dom}(a)$  ;
3.  $(f, a) \mathcal{H} (g, b)$  if and only if  $\text{ran}(a) = \text{ran}(b)$ ,  $\text{dom}(a) = \text{dom}(b)$ ,  $\text{ran}(g^{a^{-1}}(z)) = \text{ran}(f^{b^{-1}}(z))$  for  $z \in \text{ran}(a)$ , and  $\text{dom}(f(z)) = \text{dom}(g(z))$  for  $z \in \text{dom}(a)$ .

**Lemma 1.** *Let  $\sigma, \tau \in \text{PAut } T_k^{(d)}$ . Then  $\sigma \mathcal{D} \tau$  if and only if  $\text{dom}(\sigma) \cong \text{dom}(\tau)$ .*

*Proof.* Let  $\sigma \mathcal{D} \tau$ , then there exists  $\gamma \in \text{PAut } T_k^{(d)}$  such that  $\sigma \mathcal{L} \gamma$  and  $\gamma \mathcal{R} \tau$ . Thus,  $\text{ran}(\sigma) = \text{ran}(\gamma)$ ,  $\text{dom}(\gamma) = \text{dom}(\tau)$ . By definition of semigroup  $\text{PAut } T_k^{(d)}$  all these maps are isomorphisms between their domains and ranges. It immediately follows that map  $\varphi = \gamma\sigma^{-1} : \text{dom}(\tau) \rightarrow \text{dom}(\sigma)$  is isomorphism from  $\text{dom}(\tau)$  to  $\text{dom}(\sigma)$ , so  $\text{dom}(\sigma) \cong \text{dom}(\tau)$ .

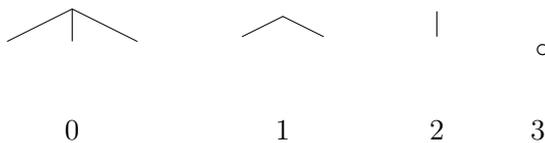

Let now  $\text{dom}(\sigma) \cong \text{dom}(\tau)$ . As before by definition of semigroup  $\text{PAut } T_k^{(d)}$  it follows  $\text{dom}(\sigma) \cong \text{ran}(\sigma)$ , hence isomorphism  $\gamma : \text{ran}(\sigma) \rightarrow \text{dom}(\tau)$  exists. Therefore,  $\sigma \mathcal{L} \gamma$  and  $\gamma \mathcal{R} \tau$ . It implies  $\sigma \mathcal{D} \tau$ .  $\square$

**Proposition 4.** *The number of  $\mathcal{D}$ -classes of semigroup  $\mathcal{I}_p^k \mathcal{IS}_d$  equals  $P^k(1)$ , where  $P(x) = \binom{x+d}{d}$ .*

*Proof.* By Theorem 1 and Lemma 1 the calculation of the number of  $\mathcal{D}$ -classes of semigroup  $\mathcal{I}_p^k \mathcal{IS}_d$  is equivalent to that of the number of non-isomorphic connected subgraphs of the tree  $T_k^{(d)}$  containing root vertex. Later on all subgraphs are supposed to be connected and to contain root vertex.

Partition the set of all connected subgraphs of the tree  $T_k^{(d)}$  into the classes of isomorphic subgraphs. Define the set of graphs-representatives denoted by  $GRep_k$  in the following way.

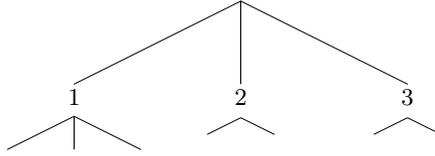

Consider firstly one-level  $d$ -regular tree. It is clear that the set of all connected subgraphs is divided into  $d+1$  class. We choose a representative from each class and number them with integers from 0 to  $d$  in decreasing order of root vertices degree. For example, if  $d = 3$  we have:

Define the following order relation on the set of graphs-representatives  $GRep_1$ . Let  $i_1, i_2$  be the numbers of graphs  $\Gamma_1$  and  $\Gamma_2$  respectively. Then  $\Gamma_1 > \Gamma_2 \Leftrightarrow i_1 < i_2$ .

Consider now 2-level tree  $T_2^{(d)}$ . Partition again the set of connected subgraphs into classes of isomorphic subgraphs. Notice that each vertex of the first level of  $T_2^{(d)}$  is a root vertex of a one-level subgraph, which is isomorphic to a certain subgraph from the set  $GRep_1$ . Attach a number sequence  $(i_1, i_2, \dots, i_l)$  to each subgraph by, where  $l$  is a degree of the root vertex and  $i_j$  is the number of subgraph from  $GRep_1$  subgraph of

$T_2^{(d)}$  with root vertex labelled by  $j$  is isomorphic to. For example, the corresponding sequence for subgraph

is  $(0, 1, 1)$ . It is evident that connected subgraphs of  $T_2^{(d)}$  are isomorphic if and only if corresponding sequences are equal up to the permutation of sequences members. Choose a subgraph described by non-decreasing corresponding sequence from each class of isomorphic subgraphs. We call these subgraphs graphs-representatives and define a linear order relation on the set of graphs-representatives  $GRep_2$  in the following way: let  $\Gamma_1, \Gamma_2 \in GRep_2$  and  $a_1 = (i_1, i_2, \dots, i_m), a_2 = (j_1, j_2, \dots, j_n)$  be corresponding sequences. Then  $\Gamma_1 > \Gamma_2$  if and only if  $a_1 < a_2$ , set of sequences is lexicographically ordered. For instance, if the number sequence related to subgraph  $\Gamma_1$  is  $(0, 0, 0)$  and the number sequence related to subgraph  $\Gamma_2$  is  $(0, 0, 1)$ , then  $\Gamma_1 > \Gamma_2$ . We have linearly ordered set and we may arrange graphs-representatives in decreasing order and number them in such a way that 0 corresponds to the “biggest” graph.

Let now  $\Gamma_0 > \Gamma_1 > \dots > \Gamma_N$  be ordered set  $GRep_{k-1}$  of graphs-representatives of  $(k - 1)$ -level tree  $T_{k-1}^{(d)}$ . Partition again the set of all connected subgraph of the tree  $T_k^{(d)}$  into classes of isomorphic subgraphs. Attach again a number sequence  $(i_1, i_2, \dots, i_l)$  to each subgraph, where  $i_j$  is the number of corresponding graph from  $GRep_{k-1}$ ,  $i_j \in \{0, 1, \dots, N\}, j = \overline{1, l}, l \leq d$ , and construct the set of graphs-representatives  $GRep_k$  of the  $k$ -level tree  $T_k^{(d)}$  as above. It is easy to check that set  $GRep_k$  has following properties:

1. For all subgraph  $\Gamma \subset T_k^{(d)}$  there exists subgraph  $\tilde{\Gamma}$  from the set  $GRep_k$  such that  $\Gamma \cong \tilde{\Gamma}$ ;
2. If  $\Gamma_1 \cong \Gamma_2$ , where  $\Gamma_1, \Gamma_2 \subset GRep$ , then  $\Gamma_1 = \Gamma_2$ .

Therefore, we have to compute the cardinality of the set of graphs-representatives  $GRep_k$  to find the number of connected non-isomorphic subgraphs of the tree  $T_k^{(d)}$  that gives us the number of  $\mathcal{D}$ -classes of semi-group  $\mathcal{I}S_d^k$ .

We use induction on  $k$  to calculate the cardinality of the set of graphs-representatives.

If  $k = 1$ , then  $|GRep_1| = d + 1 = \binom{d+1}{d} = P(1)$ .

Assume that  $N = P^{k-1}(1)$  is the cardinality of the set of graphs-representatives  $GRep_{k-1}$  of  $(k-1)$ -level tree.

Each vertex of the first level of the tree  $T_k^{(d)}$  is the root vertex of  $(k-1)$ -level tree that is isomorphic to a certain graph from  $GRep_{k-1}$ . Assume that all vertices of the first level are labelled with integers from 1 to  $l$ ,  $l \leq d$ . As set  $GRep_k$  contains no equal graphs, then corresponding sequences are all different. Hence, there exists one-to-one correspondence between set  $\{1, 2, \dots, l\}$  and set  $\{0, 1, \dots, N-1\}$ . Consider all non-decreasing functions  $f : \{1, 2, \dots, l\} \rightarrow \{0, 1, \dots, N-1\}$ . The number of all such functions is equal to the cardinality of the set  $GRep_k$ . Define  $x_0 = f(1), x_1 = f(2) - f(1), \dots, x_{l-1} = f(l) - f(l-1), x_l = N-1 - f(l)$ . Then  $f(k) = x_0 + x_1 + x_2 + \dots + x_k$ . Since  $f$  is non-decreasing, then for all  $i = 1, \dots, l$   $x_i \geq 0$ . So the number of non-decreasing functions is equal to the number of integer solutions of the equation  $N-1 = x_0 + x_1 + \dots + x_l$  for  $l = 1, \dots, d$ . Thus, we get the number of  $\mathcal{D}$ -classes of semigroup  $\mathcal{I}_p^k \mathcal{IS}_d$ :

$$\sum_{l=0}^d \binom{N+l-1}{l} = \binom{N+d}{d} = P(N) = P(P^{k-1}(1)) = P^k(1)$$

□

Let  $\Gamma$  be a subtree of the tree  $T_k^{(d)}$ ,  $St_{T_k^{(d)}}(\Gamma)$  be the stabilizer of the subtree  $\Gamma$ ,  $Fix_{T_k^{(d)}}(\Gamma)$  be the fixator of the subtree  $\Gamma$  and let  $D_\Gamma$  be  $\mathcal{D}$ -class such that for any  $\sigma \in D_\Gamma$   $\text{dom}(\sigma) \cong \Gamma$ . Let  $\{\Gamma_1, \dots, \Gamma_i\}$  be the set of all pairwise non-isomorphic subtrees of  $\Gamma$  with root vertices in the first level of  $\Gamma$ . Let  $\alpha_j$  be the number of isomorphic to  $\Gamma_j$  subtrees of  $\Gamma$  with root vertices in the first level of  $\Gamma$ ,  $j = 1, \dots, i$ . The type of  $\Gamma$  is a set  $\{(\Gamma_1, \alpha_1), (\Gamma_2, \alpha_2), \dots, (\Gamma_i, \alpha_i)\}$  such that disjoint union of vertices sets of all subtrees and root vertex gives vertices of  $\Gamma$ . Notice that  $\sum_{j=1}^i \alpha_j = l$ , where  $l$  is the degree of root vertex of  $\Gamma$ .

**Proposition 5.** *Let  $\Gamma$  be a subtree of the tree  $T_k^{(d)}$  and its type be  $\{(\Gamma_1, \alpha_1), (\Gamma_2, \alpha_2), \dots, (\Gamma_i, \alpha_i)\}$ , and degree of the root vertex of  $\Gamma$  be  $l$ ,  $l \leq d$ . Then*

1.  $|\text{Aut } \Gamma| = \prod_{j=1}^i (\alpha_j)! |\text{Aut}(\Gamma_j)|^{\alpha_j}$ ,  $l \leq d$ ,
2.  $|St_{T_k^{(d)}}(\Gamma)| = (d-l)! |\text{Aut } T_{k-1}^{(d)}|^{d-l} \prod_{j=1}^i (\alpha_j)! |St_{T_{k-1}^{(d)}}(\Gamma_j)|^{\alpha_j}$ ,
3.  $|Fix_{T_k^{(d)}}(\Gamma)| = (d-l)! |\text{Aut } T_{k-1}^{(d)}|^{d-l} \prod_{j=1}^i |Fix_{T_{k-1}^{(d)}}(\Gamma_j)|^{\alpha_j}$ .

*Proof.*

1. Prove the proposition by induction on  $k$ . Let  $\Gamma$  be one-level tree and root vertex degree be  $l \leq d$ , then  $|\text{Aut } \Gamma| = l!$ .

Assume we know the orders of groups  $\text{Aut } \Gamma_j$  for all  $j = 1, \dots, i$ . Find the order of  $\text{Aut } \Gamma$ . Degrees of root vertices of isomorphic trees are equal. Let them be  $l$ . It is clear that types of all trees isomorphic to  $\Gamma$  are equal up to the permutation of items. Thus only permutation of the first level vertices, and consequently permutation of subtrees of  $\Gamma$ , distinguishes graph  $\Gamma$  from isomorphic one. All the vertices of the first level may permute, but with several restrictions, namely, roots of non-isomorphic subtrees stay roots of non-isomorphic subtrees. Since the orders of  $\text{Aut } \Gamma_j$  for all  $j = 1, \dots, i$  are known, we can derive the order of  $\text{Aut } \Gamma$ :

$$|\text{Aut } \Gamma| = \prod_{j=1}^i (\alpha_j)! |\text{Aut } \Gamma_j|^{\alpha_j}.$$

2. The proof is analogous to the proof of the previous statement.

Consider the stabilizer of subtree  $\Gamma$  in the automorphisms group of the rooted tree  $T_1^{(d)}$ . Let the degree of the root of  $\Gamma$  be  $l$ . Then it is obvious that  $|\text{St}_{T_1^{(d)}}(\Gamma)| = l!(d-l)!$ .

Assume now that we know the order of  $\text{St}_{T_{k-1}^{(d)}}(\Gamma)$ . Let the degree of the root of  $\Gamma$  be  $l$ . Then  $(d-l)$  vertices of the first level of  $\Gamma$  may permute and each of them is the root of  $(k-1)$ -level tree  $T_{k-1}^{(d)}$ . Among  $l$  vertices, as in proof of the previous statement, distinguish only vertices that are roots of isomorphic subtrees. Then

$$|\text{St}_{T_k^{(d)}}(\Gamma)| = (d-l)! |\text{Aut } T_{k-1}^{(d)}|^{d-i} \prod_{j=1}^i (\alpha_j)! |\text{St}_{T_{k-1}^{(d)}}|^{\alpha_j}(\Gamma_j).$$

3. Taking into account that fixator of the subtree does not allow vertices permutation of this subtree, the proof is analogous to the proof of point 2.

□

**Proposition 6.** *The cardinality of the set of idempotents  $E(D_\Gamma)$  of class  $D_\Gamma$  equals*

$$|E(D_\Gamma)| = \frac{(d!)^{\frac{1-d^k}{1-d}}}{|\text{St}_{T_k^{(d)}}(\Gamma)|}.$$

*Proof* follows from one-to-one correspondence between the set of ranges of idempotents of  $D_\Gamma$  and the set  $\text{Aut } T_k^{(d)}/St(\Gamma)$ , and  $|\text{Aut } T_k^{(d)}| = (d!)^{\frac{1-d^k}{1-d}}$ .  $\square$

**Corollary 1.** The number of  $\mathcal{R}$ -classes and the number of  $\mathcal{L}$ -classes containing in  $\mathcal{D}$ -class  $D_\Gamma$  is equal to

$$\frac{(d!)^{\frac{1-d^k}{1-d}}}{|St_{T_k^{(d)}}(\Gamma)|}.$$

*Proof* follows from the fact that in inverse semigroup every  $\mathcal{L}$ -class and every  $\mathcal{R}$ -class contains exactly one idempotent.  $\square$

**Corollary 2.** The cardinality of  $\mathcal{H}$ -class containing in  $\mathcal{D}$ -class  $D_\Gamma$  is equal to  $|\text{Aut } \Gamma|$ .

*Proof.* Let  $\sigma, \tau \in \text{PAut } T_k^{(d)}$ . Then  $\sigma \mathcal{H} \tau$  if and only if  $\text{dom}(\sigma) = \text{dom}(\tau)$  and  $\text{ran}(\sigma) = \text{ran}(\tau)$ . The statement is now obvious.  $\square$

**Corollary 3.**  $|D_\Gamma| = |E(D_\Gamma)|^2 |\text{Aut } \Gamma|$ .

*Proof* follows from corollaries 1 and 2.  $\square$
